

Written Check-In: Fast Food Nutrition vs Popularity

For my semester project, I decided to pursue my second idea, which focuses on fast food nutrition and consumer demand. Initially, my argument was that the more a fast food item is marketed = the more unhealthy it is. However, after receiving feedback, I revised my approach because it was difficult to find a dataset that measures marketing for specific food items. Instead, I decided to focus on the popularity of the fast food chain. My new argument is **that the more popular a fast food item is, the more unhealthy it tends to be.**

Datasets

The two datasets I will be using are:

<https://www.kaggle.com/datasets/ulrikthygepedersen/fastfood-nutrition>

<https://www.kaggle.com/datasets/stetsondone/top50fastfood>

.

Research Questions

- Which fast food chains have the highest-calorie items?
- Which fast food chain has the highest sales?

Initial Analysis

So far, I have explored both datasets and identified key variables that will be useful for comparison, such as calories, fat, and sodium. I am currently planning how to label items as “popular” versus “non-popular” in order to compare their nutritional values.
